

Appendix B

Feedback for client

1. Do you like the layout of the application?

Yes. I think that everything is very simple and easy to understand in the application. I just think that the labels could be a bit closer to the text boxes. They seem to be very far which ruins the aesthetic of the application.

2. What do you think of the color scheme?

I think that the color scheme which you chose is very calm and not very aggressive like red would have been. It is easy on the eyes which I like because if I am working with the application all day then it would be very uncomfortable to look at aggressive colors for long periods of time.

3. Is there anything you wish that would be added to the program?

If there is anything which can be added, I would suggest that a notification system be added to the application. The application should give me a notification when I log in if there is an event on the day.

4. Any other comments?

For the book-keeping aspect of the program, I would prefer if there was a notification or something similar to a notification which would let me know how to add and remove rows because you need to tell me that I need to click enter or delete for now. If I go and show the application to someone else then it should be clear on how to use the application.

5. Are there any questions?

How can I maintain this?

- Throughout the code, there are comments which can be used to identify the methods which were used throughout the rest of the code. If you wish to make any changes, it would be easy since the program uses methods instead of repeating code everywhere. Hence, if you want to make any changes, you can edit in one place which will change how the code works everywhere else.

Can someone else edit this?

- Yes because there are comments throughout the program which makes it clear as to what

each line of code does. Anyone with a background in Java should be able to understand how each line works and be able to edit the program.

Is there anything that I need to purchase?

- You don't need to purchase anything. The program uses the community version of MySQL which is free. If you wish to make any changes which require the features of any other MySQL package, you would need to purchase the package. Additionally, if you wish to edit the program using additional features which are not available in IntelliJ Community Edition, you would need to purchase the premium edition.

How do I get this application on my computer?

- The program is stored as a JAR executable file. The file can be stored on a USB and transferred to as many computers as you wish. You would just need to copy and paste the file onto your desktop. Once that is complete, the same process can be followed to add the application to any other computer systems. Once the file has been added to the desktop, you can just click on the program to start it.

Is there a user manual or user guide?

- There is a user guide which shows step by step on how to use the program.
